AI coaching for current lesson fields

Owner: Kanish Garg. This two-field contribution is aligned with the current GitHub model: Title and Lesson Text. Lesson Text is the description-like field from the earlier work split; there is no field literally named Description in current main. The team editor should merge these sections into AICoaching.PDF.

1. Lesson Text

Coach the contributor toward a clear, reusable lesson while preserving their meaning. Keep basic length checks in the existing recognizer; the current Lesson Text limit is 20-2000 characters.

Order	Coaching requirement	Acceptance check
P1	Identify missing action, outcome or practical takeaway by asking the author questions. Never invent missing events.	Vague input produces targeted questions; no new facts are asserted.
P1	Flag ambiguous wording and suggest a clearer version while preserving technical terms and uncertainty.	Every factual claim in an edit is supported by the input.
P2	Explain spelling, grammar or blaming-tone issues and offer specific corrections.	The contributor can understand why each edit is proposed.
P2	Require explicit acceptance; retain the original when a suggestion is rejected.	No automatic save or overwrite occurs.
P3	Keep proposed text inside the existing 20-2000-character limit.	The local recognizer rejects an invalid suggestion before storage.

Candidate: Gemini Apps without a paid AI plan, for manual coaching. Google documents access without an AI plan with usage limits [S1], and text drafting/idea generation [S2]. Suitability for these lesson-specific checks is a proposal to evaluate, not an observed provider result or guarantee.

Evaluation prompt: Review this lesson text for unclear wording, spelling, tone, and missing action, outcome or takeaway. Ask about missing facts; do not invent them. Give optional edits with reasons, preserve technical terms, and keep suggestions within 2000 characters. Input: [nonconfidential sample].

2. Title

Help contributors write specific, searchable titles consistent with their Situation and Lesson Text. The current title rule is 5-100 characters, not the earlier baseline's 200-character limit.

Order	Coaching requirement	Acceptance check
P1	Flag vague titles and propose alternatives grounded only in the supplied situation/lesson.	No unsupported event or result appears in suggestions.
P1	Identify disagreement between the title and lesson text and ask for clarification.	An unrelated title is flagged rather than silently changing facts.
P2	Improve spelling/readability and preserve correct domain terminology.	Technical identifiers are retained unless the author confirms an error.
P2	Offer up to three alternatives with short explanations; let the author retain the original.	Nothing is saved automatically. Each accepted title passes the 5-100 rule.

Candidate: the same manual Gemini Apps option [S1-S2]. Proposed prompt: Given this title, situation and lesson text, explain whether the title is specific and consistent. Offer up to three supported alternatives, each 5-100 characters, with reasons. Do not invent facts.

Limits and sources

A free consumer-app option does not establish a free production API. Verify eligibility and current limits before implementation. Use nonconfidential sample lessons; Google describes possible human review of collected data [S3]. Provider responses require author review [S2]. These sections do not claim completed AI integration or unprovided LessonShare experiments.

Official sources researched October 25, 2026; field names and limits checked against repository commit 67bd0a9 on October 26, 2026.
